PREPARED FOR J SOLAR SOLUTIONS

From inquiry to a real quotation

The funnel, the calculator and the follow up that turn interest into quotable solar opportunities. Built to work whether you advertise or not.

October 2026 · Recommended approach and indicative investment

What you asked for

THE FUNNEL

A funnel that encourages interested leads to fill out a form with the details your team needs to prepare a proper quotation.

THE FLOW

Recommendations on the flow itself, so the system fits how your team actually sells, not just a build.

THE FOLLOW UP

Automation that keeps every inquiry moving instead of going quiet after the first reply.

Everything in this deck is built around those three things, in that order.

Solar cannot be quoted off a price list

Your team needs the monthly bill, the load profile, the property type and the location before anyone can put a real number on paper.

> That is not a limitation. It is the professional part of the job, and it is what separates a real solar company from someone quoting a flat rate per kilowatt.

THE PROBLEM THIS FUNNEL HAS TO SOLVE

You need a lot of information, and asking for a lot of information from cold Facebook traffic is exactly what kills the lead.

Ask for everything upfront

People start the form, see how long it is, and abandon it. You pay for the click and get nothing.

Ask for almost nothing

You collect names you cannot quote, and your team burns hours chasing the details by hand.

WHAT WE SEE WITH REAL SOLAR INQUIRIES

Interested people will ask you three questions, get three good answers, and disappear without ever leaving a mobile number.

They are polite, they are genuinely interested, and they are unreachable the moment they close the tab.

> The fix is not better answers. The fix is sequencing: get the contact details before you give away the information they came for.

Observed on a solar build we currently run live on Facebook ad traffic.

Where the leads come from

Every part of this build earns its keep on one inquiry a week and still holds at a hundred a day. Advertising is a tap you turn on, not something the system depends on.

Messenger

Answered in under a minute, any hour. You already get these.

Post comments

Every "magkano po" becomes a conversation instead of nothing.

Organic posts

The calculator as a shareable link, with post templates you can reuse.

Referral and QR

Tarpaulin, vans, flyers, cards, and a sticker on every finished install.

Google profile

Free, and solar searching is local. The funnel link lives there.

Past inquiries

Anyone who asked and never bought. A campaign on day one.

We checked your Page. No ads are running today, and there is no automated reply on Messenger. The first two above are free capture you are currently losing.

The recommended flow

01
Traffic
Any source, paid or free

02
Offer page
One page, no menu, one job

03
Calculator
Bill in, estimate out

04
Mobile
For the full breakdown

05
Stage one
Submits on its own

06
Stage two
Optional detail to quote

07
Routing
Sorted by monthly bill

08
Quote and close
Site visit, follow up, close

The calculator feeds the form. One shared bill input, two jobs, so the form feels shorter than it is.

THE PART YOUR COMPETITORS WILL NOT HAVE

An estimate, not a quotation

It answers "is solar worth it for someone like me." It cannot answer "what will you charge me," and it is not built to. The calculator has one input, the monthly bill. A real quotation needs six or more, starting with the load profile.

System size
A range in kWp, never one figure

Cost band
Drawn from your own package lineup

Monthly savings
What the bill could drop to

Payback
In years, as a range

Always estimated conservatively, high on cost and low on savings. If it says six years and your quotation comes in at four, you have a happy customer. The other way around costs you trust you cannot buy back.

It does not compete with how your team quotes, it feeds it. Every number comes from your package lineup, and every result ends by pointing at the form your team actually needs.

TRY IT YOURSELF

We built one so you can use it

A working demonstration, live now. Answer as one of your customers would, and watch the panel beside it show what your team would see.

01 Every figure shows where it came from: Meralco's September rate and DOE solar data. In your version, your own packages and service area replace the demo prices.

02 Answer as a renter, or with a bill under five thousand pesos, and watch the page decline politely while the panel tags the lead and books nothing. That is a site visit your engineers never make.

03 Choose business and no price is spoken. It goes straight to a person, because commercial is quoted by your engineers.

OPEN IT

solar.druurivera.com

The full link is in the email alongside this deck. It works on your phone.

In the demo the result opens Messenger. On your page it opens the two stage form, with the bill already filled in.

SolarLine is an invented company and its prices are demo values. Tell us your package range and service area and they become yours.

A two stage form

STAGE ONE

Captures the lead

- Name
- Mobile number
- Town or city
- Monthly bill, already filled in from the calculator
- Do they own the property
- Residential or commercial

Enough for your team to decide who is real and worth quoting.

STAGE TWO

Collects the detail

- Appliance list
- Load profile sheet
- Photo of the actual bill
- Monthly consumption in kWh
- Target system size or budget

Framed honestly: the more you share, the more accurate the quotation.

The bill is always asked as a range they tap, never as an exact figure. Nobody knows their three month average off the top of their head.

THE MECHANIC THAT MATTERS

Step one submits on its own

Most builds put everything on one page, or make step two mandatory. Both mean that someone who gets tired halfway through is lost completely.

When step one submits independently, a person who abandons step two is still a captured, contactable, qualified lead your team can follow up with.

> That one decision is usually the difference between a funnel that produces inquiries and a funnel that produces traffic.

Routing on the way in, using the bill

The monthly electricity bill is the single best early signal of system size and budget in Philippine residential solar. It lets the system sort every inquiry before a human touches it.

Smaller bills

Into nurture. The payback may not justify a system yet, so the lead is kept warm rather than quoted and lost.

Core residential

Into the standard quotation process, with the detail your team needs already attached to the record.

Large or commercial

Straight to whoever at J Solar handles those personally, instead of through a standard quote flow.

The actual thresholds come from your own package lineup, set with your team on the call. We would not guess them.

WHERE SOLAR DEALS ARE ACTUALLY WON

The sales cycle outlives the follow up effort

A solar system is a two hundred thousand peso decision. Nobody makes it on the day they fill out a form. The window runs weeks to months, and it reopens on its own when the summer bill arrives.

A person follows up two or three times, feels awkward, and stops. The deal that closes in month four never gets the fifth touch.

> **A system does not get awkward, and it does not stop.**

What the follow up actually does

When	What it does
Calculator, no form	Here is your breakdown, the exact quotation takes two minutes
On submit, to the lead	Confirms receipt and says when the quotation will arrive
On submit, internally	Alert and task to whoever prepares quotations, with a response time attached
One hour later	A single nudge if stage two was skipped. One, not a sequence
Day one	Confirm the quotation arrived and invite questions
Day three	Address cost with payback framing rather than a discount
Day seven	Proof. A completed installation, ideally near them
Day fourteen	Offer the free site assessment as the low commitment next step
Then monthly	Rate movements, financing options, new packages
Day 30, 60, 90	Reactivation for anyone who went quiet
Below threshold	Declined politely, tagged, kept in nurture, never marked lost

Every touch has a job. None of them say just following up. Someone who says next year po in October is a real buyer in March.

ONE QUESTION WORTH ASKING YOUR TEAM

1. How many quotations went out last year?
2. How many of them closed?
3. How many of the rest were never contacted again after the third attempt?

That last number is usually the largest pool of recoverable revenue in a solar business, and it costs nothing to go back for.

How you will know it is working

Four numbers tell you which stage is broken. Without them, every decision about the funnel is a guess.

Inquiries by source

Messenger, comments, organic, referral, QR. You see what works for free.

Inquiry to form

Completion on each stage, measured separately.

Hours to quotation

Submission to quotation sent. The number that bites hardest.

Quote to close

Through the site visit, with average days to close.

Cost per inquiry gets added the day you turn ads on, not before. Set up so you can see all of this yourself, without asking anyone for a report.

Investment

RECOMMENDED

₱80,000

The complete engine plus the savings calculator.

- Offer page and savings calculator
- Two stage quotation form
- Messenger assistant and comment capture
- Pipeline, booking calendar, knowledge base
- The full follow up and reactivation set
- Reporting, handover guide and training

Two to three weeks

CORE ONLY

₱65,000

Everything above, without the calculator.

The funnel works without it. You lose the self qualifying hook, the shareable asset and the prefilled bill, and the form carries the whole job of converting a cold visitor.

The calculator can be added later for ₱25,000.

Payment
50% to begin, 50% on handover. No monthly fee.

After launch
30 days of fixes included. Optional care plan after that.

Advertising
Quoted separately, only if and when you want it.

Indicative. The firm figure is confirmed once we have your package range and service area, and it will not change after that without your agreement.

What is not included, and what it costs to run

Stated upfront so nothing shifts on you later. If something comes up outside this, we tell you before we build it, not after.

Not included

- Your domain names, bought and owned in your own account
- Advertising spend, paid directly to the platforms
- Ongoing ad management
- Your platform subscription
- Photo and video production

What it costs to run

You already have the platform, so there is no new CRM subscription. Our recommendation is one sub account for the solar business, separate from the agency, since it needs its own contacts, its own Messenger connection and its own numbers.

Usage that scales with volume: assistant replies charged per reply, and email or SMS charged per send. Forms, pipelines, calendars, alerts and tasks are included in what you already pay.

One thing we will not promise: a number of leads. What we guarantee is that every inquiry gets answered in under a minute, qualified, routed and followed up until it closes or says no. How many arrive depends on traffic, and traffic is yours to control.

Five answers and we can start

- Your package range, so the bill thresholds match your real lineup
- Which towns and provinces you cover, and whether you travel outside them
- Who answers inquiries today, and how quickly during business hours
- Once you have a customer's details, how long it takes to get a quotation out
- Whether you have any record of past inquiries that never bought

Your team can answer most of these faster than you can, so feel free to forward them. We do not need a call for any of it.

THEN

Build starts within three days

Two to three weeks to live, with the capture layer on your existing channels first so it starts working before any ad spend is discussed.

Question four is the one we would most like the honest answer to. On the live build behind this proposal, quote turnaround became the constraint within days, and it is the easiest thing to fix before it bites.
